"Q Fever in the Urals, by B. Kh. Burganskiy, M. B. Kanlin-  
skiy, A. P. Vygovskiy, and I. F. Berdnikov, Zhurnal Mikro-  
biologii, Epidemiologii, i Immunobiologii, No 3, Mar 57, pp  
41-46

The presence of Q fever was first determined in the Urals in June 1954. In Kirov oblast, cases were treated as bronchopneumonia, malaria, hemorrhagic fever, etc., until diagnosed as Q fever by the complement fixation method. In 1955, a similar outbreak in a Chelyabinsk oblast was at first mistaken for leptospirosis and blamed on polluted water from the Tobol River. Symptoms were similar to those in Kirov Oblast. Magnitogorsk had similar outbreaks in 1954 and 1955.

Investigation showed that the tick population in the forests and on domestic animals was negligible (index for horses not more than 1, and for cattle 1.5). Since in all cases, horses had been used in construction work, their sera were tested with Q-antigen, and the complement fixation reaction was found to be positive. In all cases, the horses had been pastured together with cattle and goats.

Wherever Q- rickettsiae were found in domestic animals, DDT was used for disinfection, rat elimination measures were carried out, and, where advisable, the use of raw milk products from cattle and goats was prohibited. Patients with fever symptoms were kept in isolation from the first day of sickness.

For further epidemiological study and prophylaxis of Q fever, serological observation of animals and suspected patients was continued in the disease, foci, the burrows of rodents, and wherever ticks were to be found. However, "it must be admitted that these investigations are extremely difficult because of the scarcity of Q fever laboratories, Q fever antigen, and even of antiepidemic installations on the oblast level". Abstract: Work on an investigation of irrigation systems and watering procedures for potatoes was conducted by the Department of Land Improvement of the Kuybyshev Agricultural Institute in 1951-1954. It is recommended that one watering be made at the beginning of branching, one during flowering and two during tuber growth. Soil moisture must be within 60-90% of total field moisture capacity. The irrigation

Minsk-2 computer

PURPOSE AND COVERAGE: This handbook is intended for engineers studying courses in programming for electronic digital computers. The principles of operation and technical characteristics of the Minsk-2 electronic digital computer are described. Special attention is paid to the operations of the computer units and devices rather than the design and structural details of functional circuits.

**TITLE:** Plastic Deformations in Mechanical Retardation of Metal Shrinkage  
(Plasticheskiye deformatsii pri mekhanicheskom tormozhenii usadki  
metalla)

**PERIODICAL:** Izvestiya vysshikh uchebnykh zavedeniy, Chernaya metallurgiya,  
1959, Nr 2, pp 111-116 (USSR)

**ABSTRACT:** Information is given on the dependence of plastic deformation on  
mechanical retardation of metal shrinkage at different temperatures.  
Investigations of shrinkage retarded by a constant load were  
carried out on a device shown in Figure 1 and with the use of  
silumin as starting material. It was proved that the mechanical  
brake action caused retarded linear shrinkage due to elastic-  
plastic deformations. These deformations developed within  
140 seconds in two stages: intensive formation and subsequent  
attenuation. Their temperature range was from 584°C at the begin-  
ning and 350-330°C at the end. Increased shrinkage retardation  
extended the stage of intensive development and speeded-up the  
deformation rate. These factors reduced the actual shrinkage  
values. The effect of the retardation stress on the temperature  
range of plastic deformation was hardly noticeable.

TITLE: The Effect of Mechanical Shrinkage Inhibition on Hot Cracking in  
Castings

PERIODICAL: Tr. Donetsk. industr. in-ta, 1959, Vol. 36, pp. 111-120

TEXT: Results are expounded from an investigation of the inhibition of casting shrinkage at the origination of hot cracks. The design is described of a device for inhibiting the shrinkage by a force of constant magnitude. A special method is developed for determining the conditional strength limit of cast material in the temperature range of hot crack origination. It turned out that hot cracks develop at stresses of 1.7-2.0 kg/cm<sup>2</sup> in aluminum specimens of 10 mm thickness, 20 mm width, and 200 mm length, if they solidify in sand molds; the magnitude of the shrinkage inhibition force does not affect the instant of cracking, but increases their size; hereat, the tensile strength of metal increases, too. The

L 45627-65

ACCESSION NR: AP5006476

one in which the oscillation frequency is chosen to make the amplitude maximal (amplitude method). The two methods are analyzed. Descriptions of the constructed instruments are given. One is a small instrument for molten metals, and the other is a meter for continuous measurement of the viscosity of a molten metal. art. has: 9 figures and 10 formulas.

TITLE: Approximate calculation of the surface tension of molten alkali metals

SOURCE: Teplofizika vysokikh temperatur, v. 4, no. 4, 1966, 503-506

TOPIC TAGS: alkali metal, liquid metal, surface tension, fluid density

ABSTRACT: In view of the contradictory experimental and theoretical data on the surface tension of liquid alkali metals, the authors derive an approximate formula describing the effect of density on surface tension in these simple liquids based on the free volume concept. The final formula

$$\sigma = \frac{RTd}{(V-V_0) \cdot 2} \left[ 1 - \frac{3}{2} \frac{V-V_0}{V} \right]$$

is easily reduced to the Eötvös equation if density is a linear function of temperature

$$\sigma \left( \frac{\mu}{\rho} \right)^{1/6} = C(T_k - T_{\infty})$$

Card 1/2

UDC: 669.88:532.612

L 06561-67

ACC NR: AP6029775

where  $\mu$  is molecular weight,  $\rho$  is density,  $\delta$  is the thickness of the interphase layer and  $C$  is the Eötvös constant given by the formula

$$C = \frac{Rm_H^{1/2}}{2aT_{cr}}$$

where  $m_H$  is the mass of a hydrogen atom. Substitution of the constants in the final formula gives the expression

$$\sigma = 0.247T \left( \frac{\rho}{\mu} \right)^{1/2} \frac{(3\rho/\rho_0) - 1}{1 - (\rho/\rho_0)}$$

which is convenient for practical calculations. Results calculated by this formula for lithium, sodium, potassium, rubidium and cesium are compared with experimental data at temperatures from 29 to 1300°C. The divergence amounts to only a few percent. Orig. art. has: 2 tables, 6 formulas.

modulator-demodulator unit and a reel type magnetic recorder are connected in series to the output of the recording amplifier unit. For operation with the method of refracted waves, the filter unit has frequency cutoffs of 7--30 hz, and for operation at sea--frequency cutoffs of 20--50 hz. To increase the reliability of the recorded data with operation by the method of regulated directional reception, a switching unit for the channels to be summed, a static correction unit, and a summing unit are connected in series between the magnetic drum recorder and the reproduction amplifier. To increase the reliability when transferring from operation with the method of reflected waves to seismic logging, a frequency selection unit is connected between the multichannel borehole probe and the magnetic drum recorder. To improve the quality of the recorded material, an electron beam unit for introducing static and dynamic corrections is connected between the reproduction amplifier and the drum with photographic paper.

of Winter Wheat

Orig Pub: Nauchn. tr. Ukr. s.-kh. akad., 1956, 8, 37-47

Abstract: At the training farm of the Ukrainian Agricultural Academy on dark gray podzolic soil in 8-field grain and potato crop rotations, a comparison was made in 1953-1954 of the yields and quality of winter wheat grain growth on a vetch and oat fallow (VOF) and on a cover of perennial grasses (G) both without and with fertilization. The wheat yield without fertilizer in 1953 totalled on VOF 18.6 and on G-13.9, while in 1954 it was 16.2 and 16.0 centners per

"A Method by Which to Lower the Toxic Effect of Sodium Pentothal Narcosis," Prof. M. Kaplan, Inst. Obstetrics and Gynecol, Acad Med Sci USSR

"Akusher i Ginekol" No 1, 52, pp 47-51

Glucose when given to rats together with sodium pentothal in doses 0.2-0.5 per kg wt decreases the toxicity effect, but larger doses increase toxicity. A physiol [salt] soln did not affect toxicity of lethal dose. The group of opium alkaloids increased the lethal effect, but not as much as glucose. Asphyxia due to sodium pentothal is counteracted by administration of cardiazol

TITLE:

The Boundary Between the Silurian and Devonian Formations in the North-East Part of the Balkhash Region (Granitsa Silura i Devona v severo-vostochnom Pribalkhash'ye)

PERIODICAL:

Izvestiya Akademii nauk SSSR, Seriya geologicheskaya, 1958, Nr 11, pp 59 - 70 (USSR)

ABSTRACT:

The South-Kazakhstan Geological Administration in making extensive studies of the north-eastern part of the Balkhash region, have fixed the boundary between the Silurian and Devonian formations. M.A. Borisjuk and O.P. Kovalevskiy (VSEGEI) classified numerous samples of fossilized fauna from these formations and they found that the fauna from the Silurian formation belonged to the Llandoveryian and Upper-Ludlow stages, and the fauna from the Devonian formation belonged to the Gedinian and Coblenzian stages. The gradual evolution of the fauna in these formations shows that at that period, the region was a maritime basin, in which the uninterrupted accumulation of sediments continued. The Silurian and Devonian formations are single geological structures with gradual transition, which proves that at that time there were no orogenic movements in the region.

Card 1/2

SOV/11-58-11-5/14

The Boundary Between the Silurian and Devonian Formations in the North-East Part of the Balkhash Region

The presence of fossils belonging to the Upper-Ludlow, Gedinian and Coblenzian stages and their gradual evolution shows that the exact boundary between the Silurian and Devonian formations can be fixed only on the basis of the transformation of these fossils. There are 2 photos, and 7 tables and 5 Soviet references.

TITLE: Chemical mastication of natural and butadiene-styrene rubbers

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 6, 1962, 692, abstract  
6P560 (Tr. N.-i. in-ta rezin. prom-sti, sb. 7, 1960, 3 - 16)

TEXT: Methods of producing the chemical plasticizers peptone 22 (I) and rhenacite V (II) have been worked out and these substances have been synthesized under laboratory conditions. I, II and imported rhenacite IV (III) were tested as accelerators for the mastication of natural rubber and  $\text{WC-30A}$  (SKS-30A). I, II and III are effective chemical plasticizers for mastication of natural rubber in the rubber mixer at 120 - 130°C. II and III accelerate mastication of natural rubber on rollers at 70 - 80°C. I, II and III do not affect the physico-mechanical properties, the resistance to heat ageing or the swelling of rubbers. II is an effective plasticizer for SKS-30A when the rubber is being processed in the rubber mixer and on rollers. [Abstracter's note: Complete translation.]
